TITLE:

Before the Man-Flight

PERIODICAL:

Znaniye - Sila, 1960, No. 10, pp. 6-8

TEXT:

The author considers commonly wellknown facts in connection with accelerations affecting the human body in space flight from starting to re-entering and landing. The article is subdivided into the following single topics; 1) Velocity ? No, accelerations; 2) What is the load factor ?; 3) 35 g; 4) Load factor equal to zero. - In elementary form the difference between the physical conceptions of velocity and acceleration is explained and it is noted that the effect of accelerative forces can be considered as multiplied weight of the body under acceleration or deceleration; in limiting case, the zero-weight corresponds to the state of weightlessness when the acceleration is equal and opposite to gravitation. The acceleration is presented as a multiple or fraction of the gravity of the Earth, and it is equal to the load factor. - The physiological consequences of the accelerations are noted, to which the pilots will be subjected; the known results of physiological tests are briefly presented. - The known experimental units are described used commonly for producing multiplied gravity affecting the human body; the centrifuge with cabin, Card 1/2

TITLE: Vertical-Take-Off Planes 4

PERIODICAL: Znaniye-sila, 1960, No. 4, pp. 34 - 36

TEXT: The author reviews the various types of vertical take-off planes, such as the British Rotodyne, the Convair XFY-1, the Hiller X-18 "Propelloplane", the Doak 16, the French Atar Volant, the Ryan X-13 and the Coleopter. In 1936 the Soviet helicopter designer I.P. Bratukhin directed the designing of the ЦАГИ 11 ЭА (TsAGI 11 EA), a combined plane-helicopter with one bearing screw, a wing and two airplane-type tractor screws. The "Pchelka" AN-14 (AN-14) plane, designed by O.K. Antonov, has double extensible slit flaps to channel the slipstream from the propeller downwards, thus giving the plane a very short take-off and landing run. The Soviet experimental "Turbolet" was designed by A.N. Rafaelyants and V. N. Matveyev. The plane consists of a turbojet engine mounted vertically on a metal frame. The pilot's cabin and fuel tank are mounted alongside. In addition to gas controls, the "Turbolet" has jet controls consisting of jet nozzles on the ends of long protruding brackets which are fed with compressed air from the

TITLE: IL-18

PERIODICAL: Znaniye-Sila, 1960, No. 5, pp. 44-49.

TEXT: Information is given on the turboprop IL-18 passenger plane designed by Vladimir Il'yich Ilyushin. The plane is about 36 meters long and has a span of more than 37 meters. It is powered by 4 turboprop engines developing a total thrust of 16,000 equivalent HP. The plane cruises at speeds up to 650 km/h and has a range of 5,000 km with reserve fuel. The take-off run is 800-1,200 m and the landing distance 600-700 m. Take-off weight is 59 tons. The plane is designed for maximum day and night-flying safety at temperatures of from -60 to +60° C in all-weather conditions. It is capable of flying easily on 3 or even 2 engines and is fitted with radar-fix equipment and excellent de-icing and fire-fighting apparatus. The passenger accomodation is for 65 first-class or tourist passengers plus 8 sleeping bunks. This arrangement can be rapidly converted at the airport into an 83- or 89-seater. There is also an alternative lay-out for a 111-seater. Airconditioning to a constant 20°C and normal humidity is provided. ✓

TITLE: ~~XXXXXXXXXXXXXXXXXXXX~~
The Design of KA-10 (KA-10) ⁴

PERIODICAL: Znaniye-Sila, 1960, ³⁵No. 7, p. 54

TEXT: In No. 4, 1959, of this periodical the article "Soviet Gyroplanes" was published. Many readers wrote to the editor asking for details on the design and operation of Ka-10, the smallest Soviet helicopter designed by Nikolay Il'ich Kamov. These requests are complied with in this article. Ka-10 is a single-seat coaxial helicopter with two carrying propellers which are placed above each other and rotate in opposite directions thus ensuring the stability of the plane. Their diameter is 6.13 m. The fuselage consists of thin-walled welded steel tubes and there is no plating, no covered cockpit and no stabilizer. There is a vertical bearing at the tail and the carrier column is attached to the fuselage. The propellers are driven by an AM-4Г (AI-4G) motorcycle engine of 55 hp at 4,500 rpm. Beneath the fuselage are two rubberized inflated balloons which ensure smooth landing on land and water. The helicopter can remain air-borne for two hours, its flying range is 195 km and its maximum speed 116 km/h. ✓

TITLE: Return to earth

PERIODICAL: Znaniye-sila, no. 7, 1961, 10-13

TEXT: The article reviews the equipment and techniques in standard use for emergency escape from high-speed jet planes, with especial reference to ejection seat design, controlled descent and the physiological effects of ejection and exposure to high altitudes on the pilot. The author explains how high-altitude suits and compensating suits help the pilot to withstand these stresses and survive a bail-out at altitudes as great as 12 km. All the information is based on Western sources. The author mentions prototype capsules which consist in effect of the whole forward portion of the fuselage together with the cabin, the entire unit being detached from the rest of the plane in an emergency to descend by parachute. A development of this method is used for landing astronauts from satellites. Emergency escape

cabins for astronauts have also been developed. The pilot's cabin is equipped with a powerful rocket motor which can catapult the cabin to a height from which it can descend by parachute, should any mishap occur during launching. The motor is powerful enough to eject the capsule from the carrier-rocket even when the main rocket engines are functioning during the active phase of flight.

TITLE: Activation determination of impurities in gallium

SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya khimicheskikh nauk, no. 1, 1966, 138-139

TOPIC TAGS: gallium, quantitative analysis, neutron irradiation, *CHEMICAL PURITY*

ABSTRACT: A sample of gallium weighing 100 mg was placed in a quartz ampoule which was then sealed and irradiated with a stream of slow neutrons, 1.8×10^{13} N/cm²-sec, for 8 hours. After irradiation, the gallium together with the carriers (about 10⁻⁵ grams of each element) was dissolved in aqua regia and the solution was evaporated to dryness. The precipitate formed was dissolved in 10 ml concentrated hydrochloric acid. The gallium was extracted three times from the solution obtained. The aqueous phase containing the impurity elements was evaporated three times in a mixture of nitric and hydrofluoric acids, almost to dryness.

Cord 1/2 UDC: 543.53

ACC NR: AP6016128

The precipitate was dissolved in a small amount (5-10 drops) of 6 N HF and the solution was introduced into a Teflon column filled with Dowex-1 anion exchange resin in the F⁻-form. Determinations were made for the following metals: cobalt, copper, indium, zinc, arsenic, tellurium, and tin. (The analytical results are shown in a table. Orig. art. has: 1 figure and 1 table.

TITLE: Investigation of the extracting properties of 2,2'-dichlorodiethyl ether
(Chlorex)

SOURCE: AN SSSR. Doklady, v. 164, no. 5, 1965, 1044-1045

TOPIC TAGS: extraction, separation, ion

ABSTRACT: In the course of searching for new extracting agents, it appeared profitable to investigate the properties of 2,2'-dichlorodiethyl ether (Chlorex). It was expected to behave differently from diethyl ether, because of the presence of two chlorine atoms in the molecule. It was found to extract Sb(V) and Fe(III) well, Sn(IV), Te(IV), In(III) slightly, and Zn(II), Cu(II), Co(II), Mn(II), Cr(III), As(V), and Ag(I) practically not at all. The partition coefficients are given in tabular form. Orig. art. has: 1 table and 1 figure. [VS]

UDC: 621.372.3.024.008

ACC NR: AP6033662

configuration designed for use in analog-to-digital converters. The dimensions of the detector are 4.5 x 1.5 x 0.4 mm. Depending on the application, the cassette may contain any number of detectors. The detector spectrum is similar to that of the xenon pulse lamp normally used in analog-to-digital converters. Some of the detector parameters are: operating temperature, 100° with amplitude changes not greater than 10% from the value measured at 20°; experimental values of capacitance and resistance of the p-n junction (at zero bias), $(1.5-2) \times 10^{-10}$ and $(1-3) \times 10^4$ ohms, respectively; photoconductive time delay for a bias of 10V $(5-8) \times 10^{-9}$ sec; 1% threshold sensitivity, 10^{-8} lm. The large working surface and uniform sensitivity (within 3%) of the photodetector simplify adjustment and alignment of the optical system. The device can also be used in a number of other computer circuits. Orig. art. has: 4 figures.

TITLE: CC-26-51D Station Amplifiers for High Frequency Seismic
Geophysical Exploration (Usiliteli stantsii SS-26-51 D
dlya vysokochastotnoy seysmorazvedki)

PERIODICAL: V Sb.: Razvedochnaya i promyslovaya geofizika. Nr 15,
Moscow, Gostoptekhizdat, 1956, pp. 81-83.

ABSTRACT: Amplifiers of the widely used CC-26-51D stations can be
used for high frequency (from 60 to 120 cps and higher) seismic
geophysical exploration on the condition that the filters and
output stages are changed. The converted filter and output stage
circuits and their frequency characteristics are given. Low
frequency attenuation amounts to 32 to 24 db (instead of 15 to
17 db for stock amplifiers). The redesigned amplifiers can be
used even in the 30 to 50 cps frequency range.

AUTHORS: Gil'bershteyn, E. G. and Gurvich, I. I.

TITLE: The velocities of elastic waves in perforated materials for seismic modeling

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 2, 1963, 20, abstract 2D122 (Izv. vyssh. uchebn. zavedeniy. Geol. i razvedka, 1962, no. 5, 116-131)

TEXT: A description is given of experiments aimed at a study of the velocities of elastic waves in duralumin, plexiglass and brass, used for seismic ultrasound modeling. The main results of the investigation are as follows: the velocity of longitudinal waves v_p in perforated sheets varies linearly with the number of holes, Q , and may be calculated from a quoted empirical formula. The latter must include a parameter γ , determined experimentally for the materials tested. The dependence of transverse wave velocities v_s on

Card 1/3

S/169/63/000/002/097/127
D263/D307

The velocities of ...

the extent of perforation is also linear in certain range of Q 's; this is less clearly pronounced than for longitudinal waves. Calculation of the velocity V_p should be carried out with the aid of experimentally obtained graphs. The velocity ratio v_p/v_s in the perforated materials studied is found to vary from 1.77 to 1.60. In duralumin V_p/V_s is a linearly decreasing function of Q . In plexiglass, the decreasing character of the relation of V_p/V_s with Q appears from $Q > 0.2$. Perforated plates submerged in water are characterized by higher velocities than plates surrounded by air. The dependence $V_p(Q)$ determined for this case demonstrates the possibility of applying perforated plates for simulating thin layers with directional elastic properties in the solution of three-dimensional problems. Anisotropy of v_p is clearly shown in materials with a square grid of apertures, and increases with increasing number of holes. A definite value of Q exists below which the anisotropy is practically not observed. Application of many types of

Card 2/3

S/169/63/000/002/097/127
D263/D307

The velocities of ...

grids allows simulation of either isotropic or anisotropic media. It was not possible to find dispersion of the velocity V_p between 30 and 115 kc/s in plexiglass and between 25 and 250 kc/s in dur-alumin. The authors observed a non-parallelism of phase hodographs, caused by selective absorption of high frequencies, as a result of which the apparent velocity of later phases appear somewhat lower (by 2 - 3%). The velocity of surface waves depends on Q. This relationship is shown less distinctly than for longitudinal waves. [Abstracter's note: Complete translation.]

ABSTRACT: A method is described for computing arrival time and phase of seismic waves for processing time into a digital computer from multichannel correlated seismograms obtained by the oscillographic method or by an inked graph. Variable tape transport mechanism speeds are minimized as a readout accuracy factor by employing magnetic material to make the strokes marking both time and the arrival times and phases. These strokes are read out by magnetic heads, the number of pulses corresponding to the strokes for the time marks is summed, and with . . .

TOPIC TAGS: seismic modeling, perforated material, seismic wave, ~~model~~, elastic wave, ~~propagation~~ *wave propagation.*

ABSTRACT: A description is given of the use of perforated materials for controlling density and elasticity in ultrasonic seismic-wave modeling experiments conducted in the Institute of Physics of the Earth of the Academy of Sciences USSR and the Moscow Geological Prospecting Institute. Parametric measurements were made on two-dimensional sheets of duralum, brass, iron, and plexiglass containing perforations ($d = 1-10$ mm) arranged in triangular, hexagonal, and rectangular grids. The ratio of the dominant wavelength to the distance (which ranged from 2.5 to 20 mm) between the perforations varied from 4 to 50 depending upon the type of sheet and the nature of the experiment. Experiments were conducted to establish: 1) the possibility of recording regular

Card 1/2

I 47138-66

ACC NR: AT6031368

0

longitudinal and shear waves, 2) the relationship between the effective elastic-wave propagation velocities and the size, number, and shape of the perforations, 3) the dispersion velocities, 4) the absorption of the elastic-wave energy, and 5) the possible appearance of velocity anisotropy and absorption in sheets with different perforation patterns. The results of experiments showed that under certain conditions regular longitudinal, shear, and surface waves arise in perforated materials and propagate with characteristic velocities almost without dispersion or attenuation as determined by the coefficient of effective absorption. Thus, perforated materials under specific conditions behave like a macrohomogeneous, nonideal, elastic medium to which can be imparted isotropic, anisotropic, or smoothly changing properties. The applicability of these materials in seismic modeling is determined by the appropriateness of the elastic, density, and absorbing properties of the rock to the analogous parameters, which can be controlled in perforated sheets by changing the perforation pattern. The accuracy of reproducing properties in these models is very high, reaching 1-2% in the case of velocity. Orig. art. has: 4 figures. [DM]

TITLE: Construction of wide-band transducers for seismic modeling

SOURCE: AN SSSR. Institut fiziki Zemli. Geoakustika; ispol'zovaniye zvuka i ul'tra-zvuka v seysmologii, seysmorazvedke i gornom dele (Geoacoustics; the use of sound and ultrasound in seismology, seismic prospecting, and mining). Moscow, Izd-vo Nauka, 1966, 62-64

TOPIC TAGS: acoustic detector, acoustic receiver, seismic modeling, seismology, wide band transducer

ABSTRACT: A new type wide-band receiver to be used in seismic modeling is described. It consists of Rochelle salt plates of different thickness and height, each with its own natural frequency, which form a receiver with wider band-frequency characteristics when stacked together. The damping of natural frequencies was accomplished by covering the stack with a 1-2-mm thick layer of transparent epoxy resin. The receiver, shown in Fig. 1, requires no clamp, as the contact is established by a thin layer of vaseline. A pulse transmitted through a brass sheet consisted of a single vibration with an apparent frequency of 100 kcps and a pulse duration of 16 μ sec. Compared to the older-type receivers, the total pulse duration of the new

SOURCE: AN SSSR. Izvestiya. Fizika Zemli, no. 12, 1966, 11-27

TOPIC TAGS: seismic modeling, interference wave, ultrasonic seismoscope, seismologic instrument

ABSTRACT: Two-dimensional seismic waveguide model investigations were conducted in which the kinematic and amplitude characteristics of interference waves were examined in relation to the thickness of the layer. Duralum models (1000 x 500 x 2 mm) were used. A perforated band with a triangular network of apertures served as the waveguide layer. Rochelle salt crystals (6 x 6 x 6 mm) acted as receivers, while an ultrasonic seismoscope recorded both narrow (60 kc) and broad (600 kc) bands. The effect of changing the location of the source relative to the layer on the amplitude of the interference waves both within the layer and in the surrounding medium was studied. In the case of a solid low-velocity layer a very

SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya khimicheskikh nauk, no. 1, 1966, 88-90

TOPIC TAGS: thallium, sorption, gamma spectrometer

ABSTRACT: The gamma-spectrometry method was combined with the rapid chemical separation of impurities to determine Sb, Ga, Fe, In, Zn, Cu, Co, As, Te, and Sn in thallium. The authors' study of the extraction equilibria in the system beta, beta'-dichlorodiethyl ether ('khloreks')-water solutions of hydrochloric acid for a large number of elements indicated that Tl can be removed by extraction with khloreks from 3N HCl, while Sb, Ga, and Fe can be separated from the remaining micro-impurities by extraction from 9-10N HCL. The Co, Cu, In, Zn, As, Tl, and Sn impurity elements can be divided into two groups on the bases of different sorption capacity of fluoride complexes on anionite. Sn, As, and Te, with a concentration of 5-3 N HF are sorbed on the anionite whereas Co, Cu, In, and Zn freely pass through the column. Nuclear-physical characteristics of the elements Co, In, Zn and Cu as well as Sb, Ga, and Fe, permit their identification without further chemical separation. Orig. art. has: 2 figures and 2 tables. TITLE: Optimum characteristics of nonlinear converters in the presence of interferences

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 4, 1965, 148-153

TOPIC TAGS: nonlinear control system, automatic control design, control circuit, signal interference, signal to noise ratio, random noise signal, filter circuit

ABSTRACT: In automatic control systems there is often a need for nonlinear conversion of signals. To exclude various interferences such conversion systems contain an input filter which smoothens out the input signal. However, such engineering solutions are often far from the optimum one. Consequently, this author investigates the synthesis of nonlinear converters for random input signals obeying the normal distribution law. The discussion follows the general theory of optimum nonlinear filtration developed by V. S. Pugachev (Teoriya sluchaynykh funktsiy i yeye primeneniye k zadacham avtomaticheskogo upravleniya, Fizmatgiz, 1962). For various kinds of nonlinear conversion the paper gives estimates of the sensitivity of a given system to the type of nonlinearity as a function of the signal-to-noise

TITLE: Separation of a signal from its nonlinear transformation in a random noise background

SOURCE: Leningrad. Politekhnicheskii institut. Trudy. no. 252. 1965. Dinamika i prochnost'mashin, mekhanika i protsessy upravleniya (Dynamics and durability of machines; mechanics and processes of control.) 127-132

TOPIC TAGS: signal analysis, signal detection, signal identification, signal noise separation, random noise signal

ABSTRACT: The problem of determining the signal $x(t)$ when the input to the measuring instrument is the sum of some nonlinear function of the signal $y = \phi(x)$ and of some random noise signals $n(t)$ (i.e., $z(t) = y(t) + n(t)$), is discussed. The problem may be reduced to finding a nonlinear transformation $x^* = x(z)$ which will give the optimum approximation $x^*(t)$ for the signal $x(t)$. Minimizing the dispersion

$$M \{ |x(z) - \phi(y)|^2 \} = \min;$$

an expression for the transformation is found as

Card 1/2

L 13922-56

ACC NR: AT5028839

$$\chi(x) = \frac{\int_{-\infty}^{\infty} \psi(y) f_y(y) f_n(x-y) dy}{\int_{-\infty}^{\infty} f_y(y) f_n(x-y) dy}$$

[where $f_n(x)$ = probability density of noise $n(t)$; $x = \psi(y)$ = solution of $y = \phi(x)$ for x ; $f_y(y)$ = probability density of process $y(t)$]. The dispersion of the error of the optimum transformator $\overline{\sigma^2}$ is found as

$$\overline{\sigma^2} = \overline{\psi^2(y)} - \overline{\chi^2(x)}$$

given by A. A. Pervovvanskiy (Sluchaynyye protsessy v nelineynykh avtomaticheskikh sistemakh. M., Fizmatgiz, 1962, s. 351). If, instead of the optimum characteristic $\chi(x)$, the nonlinear transformation $\chi_1(x) = \psi(x)$ is used, then the error dispersion $\overline{\sigma_1^2}$ becomes

$$\overline{\sigma_1^2} = \overline{\psi^2(y)} - \overline{\chi_1^2(x)} + \overline{\chi_1^2(x)} - [\overline{\psi(y)} - \overline{\chi_1(x)}]^2$$

The calculation procedure is demonstrated for the nonlinear function $y = k^2 x^2$ with $x(t)$ and $n(t)$ assumed as uniformly distributed random processes. Orig. art. has: 2 figures and 22 formulas.

TITLE: Optimal nonlinear inertialess transformation of the signals of several instruments taking the nonreliability of their operation into account 14

SOURCE: Avtomatika i telemekhanika, no. 2, 1965, 70-75 25 FF

TOPIC TAGS: reliability theory, reliability engineering, system reliability

ABSTRACT: The author determines the nonlinear characteristic of a device which is optimal with respect to the minimum error dispersion criterion for the problem of the conversion of data from several imperfect instruments. It is assumed that the random error distributions are known for a normal operational mode of the instrument and for failure of the instrument. It is shown for the case of three instruments that the characteristic presented assures the averaging of reliable data and rejection of unreliable data. The reliability threshold is determined by the a priori probability of instrument failure. Orig. art. has 3 figures and 25 formulas. 2

TITLE: Regulation of the base line in gas-liquid chromatography

PERIODICAL: Analytical Chemistry, 34(1), 1962, 41-48.
Abstract 2557 (Chromatography) 1961, ...
in. lit. 111 - 231

TEXT: A study is made of the effect of changes in pressure and flow rate of the carrier gas, of the humidity content, and of volatilization of the stationary phase on the stability of the base line for chromatography using a katharometer. All these factors may cause instability of the base line. For removal of the effect of pressure change, a system of separate currents through the measuring and comparison chambers of the detector is recommended. An improved design is suggested for a membrane controller to maintain a constant gas flow rate and apparatus for removal of humidity from He (absorption column with molecular sieve). To prevent deflection of the base line caused by the presence of volatile impurities in the phase, this should be treated initially in vacuo. By using the

TITLE: Temperature

SOURCE: Fizikai szemle, no. 10, 1965, 304-311

TOPIC TAGS: temperature, thermodynamics

ABSTRACT: Scientific, experimental, and philosophical aspects of temperature were discussed and some common misunderstandings regarding temperature were traced to their origin and dispelled. The following subjects were dealt with: experimental aspects of the temperature concept, theoretical development of the theories dealing with heat and temperature, feasibility of the realization of a system endowed with empirical temperature, concept of absolute temperature, characteristics of absolute temperature, and philosophical ramifications of the temperature concept.

Title : Electronic Structure of Cr(III) Hexacyanide Complex Ion by the LCAO Method.

Orig Pub: Acta phys. et chem. Szeged, 1957, 3, No 1-4, 42-48.

Abstract: The complex $[\text{Cr}(\text{CN})_6]^{3-}$ was studied by the MOLCAO method. Nine 3d-, 4s- and 4p-orbits of Cr with 3 electrons (corresponding to the Cr^{3+} ion) and three 2p-orbits of each C atom with 4 electrons at every atom were considered. The 27 available AO-s were divided according to types corresponding to irreducible group concepts of O_h : $G = 2A_{1g}$ (4s and the linear combina-
